TO: Our Valued Customers and Partners

RE: End of Life Announcement

Nextivity has a long history of bringing intelligent cellular solutions to market with our partners. Our Cel-Fi GO G31, GO G32, PRO, PRIME, DUO, and SOLO have been cornerstones of our business and have supported technologies like 2G, 3G and 4G for longer than 7 years, helping customers solve signal problems in buildings and vehicles around the world. As production processes have shifted in recent times, we are unfortunately forced to begin the EOL process for these solutions.

In April we announced the EOL of DUO, PRIME and PRO. Today we are announcing the EOL of GO G31, GO G32, and SOLO and will work with each of you to ensure we take your needs into consideration as production for these solutions winds down. Some of these product lines will be retired quickly while others have some longevity.

We recognize the difficulty of this process and the dependence our customers and partners have on these solutions. Nextivity continues to invest in our newest generation of products, including our patented IntelliBoost chipset. IntelliBoost is unique in the industry and is now in its 4th generation, and we are currently in development on our 5th generation which will bring even more performance and network safety to future products. As we work with you to migrate to our newer technologies you will be able to better support evolving network requirements, and we are committed to providing the resources to ensure our new products are certified for local carriers' and customers' networks as soon as possible.

Attached you will find the formal EOL notification as well as answers to questions you may have.

Sincerely,

Stephen M. Kowal
Chief Commercial Officer
